Sample IT Helpdesk FAQ

PeopleDesk AI demonstration document — fictional IT guidance

Important notice

This is fictional troubleshooting guidance for testing the helpdesk project. Follow your actual organization's IT security procedures and contact its IT team for official instructions.

1. VPN connection is not working

Confirm that your device has an internet connection by opening an approved internal or public website.

Check that you are using the organization-approved VPN client and the correct sign-in method.

Disconnect and reconnect once. If the issue persists, restart the VPN client and note the exact error message.

Do not share your password, one-time passcode, recovery code, or private key with support staff.

If the issue continues, raise an IT ticket with the device operating system, approximate time of failure, VPN client name, and exact error message. Do not include passwords or authentication codes.

2. Password or account access issue

Use the organization's approved password-reset page or identity-provider workflow.

If you suspect an account compromise, contact IT or security immediately using a verified company channel.

IT staff should never ask you to send your password in plain text.

3. Wi-Fi or network issue

Check whether other approved websites or applications work.

If possible, verify whether colleagues nearby are experiencing the same issue.

Record your device type, network name if safe to disclose, location or office site, and the time the issue began.

Do not attempt to bypass network controls or install unapproved network tools.

4. Laptop or application is slow

Save your work, close applications you are not using, and restart only when it is safe to do so.

Record the affected application, approximate time, recent changes, and any displayed error message.

Do not install unapproved software or disable endpoint protection.

5. What to include in an IT ticket

Use a short descriptive title, such as 'VPN connection fails after sign-in'.

Describe the expected behavior, actual behavior, steps to reproduce, when the issue started, and troubleshooting already attempted.

Choose a priority based on business impact and urgency, following your organization's actual priority definitions.

Never include passwords, one-time codes, private keys, or unnecessary personal information.

6. Ticket lifecycle

Open: the ticket has been created and is awaiting review.

In Progress: support is investigating or working on the issue.

Resolved: support has recorded a resolution. Follow your company's process if the issue returns.

Cancelled: the request was cancelled according to the organization's process.

7. Example questions for the helpdesk assistant

My VPN is not connecting. What should I check?

What details should I include when I raise a ticket?

What should I do if I think my account has been compromised?

For demonstration and software testing only. This document is not legal, medical, security, or official company advice.
